Objectives

- To provide an application using Ethereum to record and build user profiles for pharmaceutical prescriptions based off of Ethereum transactions
- Users will execute smart contracts designed to bundle pharmaceutical information for Healthcare professionals
- Out of network hospitals and pharmacies need to validate patients' pharmaceutical records and transactions for patient health and safety

Market Readiness

- Our product allows healthcare specialists to analyze a patient's drug history to prevent fatal prescriptions such as combining incompatible chemicals
- Current electronic records are centralized and patient accessibility is challenging; blockchain allows decentralization and easier accessibility
- Smart contracts allow out of network healthcare specialists to validate medical history reliably

Pharmaceutical Records Validated Through Ethereum
